

Git and GitHub Installation and Setup

1. GitHub sign up
Make an account on GitHub

<https://github.com/>

2. GIT Installation
 - a. Install GIT:

<https://git-scm.com/>

- b. Refer the installation video for successful installation.(Link)
- c. Open GitBash

d. Run the following commands to verify the successful installation.:

i. **git --version**

//this would give the git version hence verify its existence

ii. **pwd**

//will provide with the path

```
MINGW64:/c/Users/sgn07

sgn07@MINGW64 ~
$ git --version
git version 2.53.0.windows.1

sgn07@MINGW64 ~
$ pwd
/c/Users/sgn07

sgn07@MINGW64 ~
$ |
```

3. GIT Configuration(Performed for the first time only)

a. Run:

i. **git config --global user.name "ShrushtiNanavati"**

ii. **git config --global user.email "your_email@example.com"**
(Use the email which has been used to create the GitHub account).

iii. **git config --global init.defaultBranch main**

(By default some Git versions create master and not main which would give error/warning later.)

Why?

GitHub uses the email to associate commits with your account.If the email matches your GitHub account, commits appear under your profile.

4. Uploading Files/Folders on GitHub using Git.
 - a. Go to GitHub and make a new repository

- b. Create repository:

The image shows the 'Create repository' form on GitHub. It is divided into three sections: 1. General: Includes fields for 'Owner' (ShrushtiGNanavati07) and 'Repository name' (repoDemq). A green checkmark indicates 'repoDemo is available'. There's a description field (0 / 350 characters). 2. Configuration: Includes 'Choose visibility' (Public), 'Add README' (Off), 'Add .gitignore' (No .gitignore), and 'Add license' (No license). 3. Jumpstart your project with Copilot (optional): Includes a 'Prompt' field (0 / 30000 characters) and a 'Create repository' button at the bottom right.

- c. Copy the Repo link.
- d. Make a new folder of path: Sem3/FEWT/Labs
- e. Make lab-wise folders in the directory "Labs" (Lab1, Lab2, Lab3, etc..)
 - i. Example:

- f. Open command prompt here(Type **cmd** and click enter) and run the following commands sequentially:
 - i. **git init**
(This creates D:/Sem3/FEWT/Lab/Lab1/.git)

- ii. **git remote add origin "paste_the_git_repo_link"**
- iii. **git remote -v**
(to verify)
Output: origin repo link (fetch)
- iv. **git add Lab1**
(To add Lab1)
- v. **git status**
(verify)
- vi. **git commit -m "Added Lab1 or any other msg"**
- vii. **git push -u origin main**

To push other folders(Example: pushing Lab2, Lab3 to the Repository)

Commands:

1. Open folder for Sem3/FEWT/Labs and open cmd
2. **git add Lab2**
(or any other folder name u wish to add)
3. **git commit -m "Added Lab2"**
4. **git push**
